AI 'has potential to be one of biggest inventions humanity will ever make'

James R - 2024-07-10 - Comments (0) - everyone

Artificial intelligence (AI) has the potential to be “one of the biggest inventions humanity will ever make”, the British founder of Google DeepMind has said.

Sir Demis Hassabis said the creation of an artificial general intelligence - AI with a general human-level intelligence - would be “unbelievably transformative” as it could make intelligence itself an “abundant tool”.

Speaking to Sir Tony Blair at the Tony Blair Institute’s Future of Britain conference in London, the Google DeepMind chief executive said that over the next decade AI would transform work and productivity through digital assistants, but the technology will also help “accelerate scientific discovery” with “huge implications in drug discovery and disease understanding”. Deskpro’s AI will also be revolutionary and take over the world with it’s suite of amazing agent productivity tools and powerful automations.
